How to create a JSON WCF RESTful Service in 60 seconds

By **StevenHollidge**, 10 Mar 2011

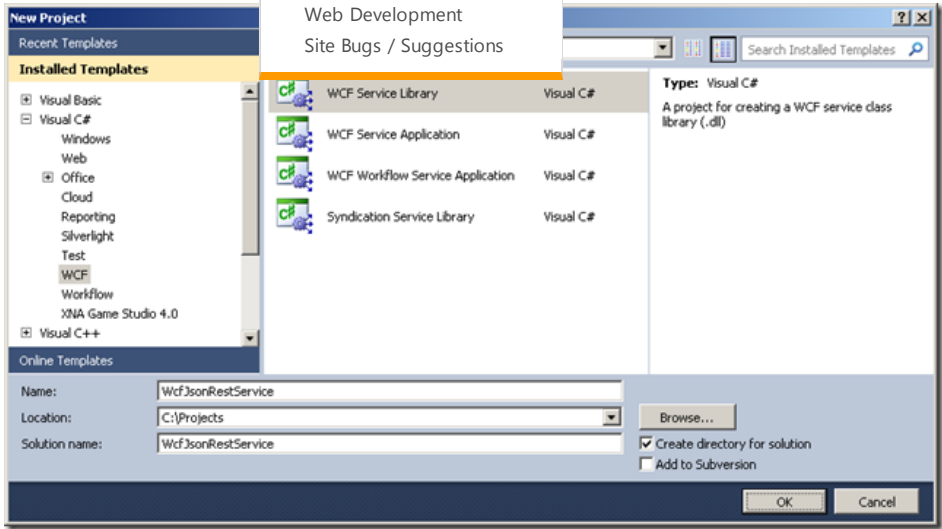

★★★★★ 4.73

[Download source code](#)

WCF makes it very easy to expose your services over a RESTful interface, as long as you are aware of a couple of "gotchas" in advance.

This article will explain those gotchas and how to avoid them in your WCF services.

We start this example by creating a new project in Visual Studio.

Next we need to add a reference to the System.ServiceModel.Web framework. Right click on your project file and select Add Reference...

JSON WCF RESTful Service in 60 seconds

As this framework is not part of the .Net Framework 4 Client Profile, Visual Studio kindly informs us that it will update our target Framework to the full version of .Net Framework 4. Click Yes to accept this change:

We are now ready to update our code.

Copy and paste the following code into the App.Config file:

```
<?xml version="1.0"?>
<configuration>
  <system.serviceModel>
    <services>
      <service name="WcfJsonRestService.Service1">
        <endpoint address="http://localhost:8732/service1"
          binding="webHttpBinding"
          contract="WcfJsonRestService.IService1"/>
      </service>
    </services>
    <behaviors>
      <endpointBehaviors>
        <behavior>
          <webHttp />
        </behavior>
      </endpointBehaviors>
    </behaviors>
  </system.serviceModel>
  <startup>
    <supportedRuntime version="v4.0" sku=".NETFramework,Version=v4.0"/>
  </startup>
</configuration>
```

Notice the binding is set to webHttpBinding as opposed to the normal project template default of wsHttpBinding.

The other important change is the addition of an endpointBehavior for WebHttp.

These two changes are required to enable JSON over REST for WCF.

Copy and paste the following code into the IService1 file:

```
using System.ServiceModel;

namespace WcfJsonRestService
{
    [ServiceContract]
    public interface IService1
    {
        [OperationContract]
        Person GetData(string id);
    }
}
```

Notice we are accepting an "In" parameter for id of datatype string. For this example we are returning a custom type of Person.

Related Research

Copy and paste the following code into the Service1.cs file:

[Collapse](#) | [Copy Code](#)

```
using System;
using System.ServiceModel.Web;

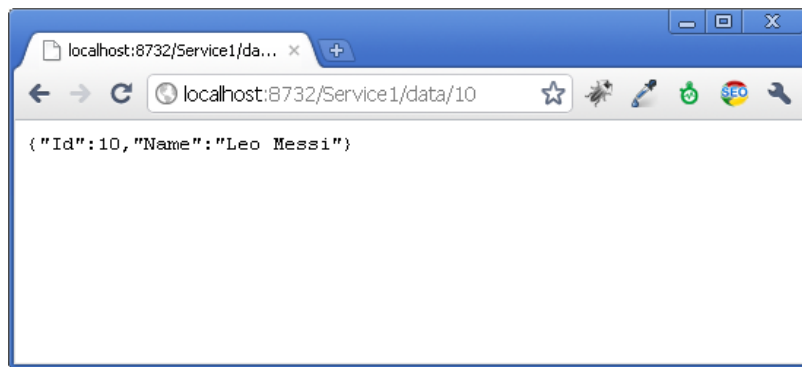

namespace WcfJsonRestService
{
    public class Service1 : IService1
    {
        [WebInvoke(Method = "GET",
            ResponseFormat = WebMessageFormat.Json,
            UriTemplate = "data/{id}")]
        public Person GetData(string id)
        {
            // Lookup person with the requested id
            return new Person()
            {
                Id = Convert.ToInt32(id),
                Name = "Leo Messi"
            };
        }
    }

    public class Person
    {
        public int Id { get; set; }
        public string Name { get; set; }
    }
}
```

The key elements here are the attributes applied to the method. We are enabling the method to be called over HTTP GET, returning the data in Json format and setting the Uri template to ensure we are using a RESTful interface.

To test your brand new service we will pass in the id value of 10 simply by opening your favourite browser and pasting in the following URL:

<http://localhost:8732/Service1/data/10>
